

TETHERSROBOTICS

Presented by:
Dr. Nathan Britton
Systems Engineering Manager
Tethers Unlimited, Inc.
nbritton@tethers.com

Hardware:

KRAKEN Robotic Arm

- Modular Joints
- Active Compliance
- Embedded Controller

MANTIS

- Robotic EXPRESS Rack locker for ISS
- Payload Automation
- 6DoF Microgravity Controls Testbed

AXON Connector Family

- ARTIE Tool Changer
- Dactylus Soft Capture End Effector
- Structure Connectors

Software and Controls:

Cylon

- Control of Multiple Robotic Arms
- GNC/ADCS Integration

MOSAIC

- OSAM Dynamics Simulation
- Multi-Agent/Formation Controls
- Large Structure Distributed Attitude Control

AstroPorter

- Dynamic Mass Properties Estimator
- Multi-Agent Cargo Handling Solution
- Evaluating on Astrobee Testbed

TUI Robotics Applications

Spacecraft Automation

On-orbit Servicing

Materials Processing & Assembly

Constructable Platforms

OSAM - The Longest Meter

- **Control problems in the last meter after rendezvous and prox ops**
 - **Client Characterization**
 - **Soft-Capture**
 - **Vibration Mitigation**
 - **Dynamic Mass Properties**
 - **Coupled ADCS**

Force-controlled manipulator developed for NRL and NASA's Robonaut Team to enable:

- On-Orbit Servicing, Assembly and Manufacture (OSAM)
- Automation for volume/mass constrained missions
- Safe Co-working with Astronauts

Features:

- Series Elastic Actuators
- Modularly Configurable Joints
- Force Control & Active Compliance
- On-board Embedded Controller

Baseline KRAKEN Configuration:

- 7 DoF
- 1m Reach
- Mass: 7.1kg
- Payload Capacity: 500g in 1G

Modular Joint Design

Specifications

- 10Nm, 30Nm, 60Nm, 120Nm Joint Sizes
- 50mNm, 250mNm, 500mNm, 1Nm accuracy
- $\pm 345^\circ$ rotation range
- Back-drivable @ 1Nm
- EtherCAT motor driver for kHz set-point control frequency

Series Elastic Actuators

- Planar disk spring between drive & link output
- Co-located (direct) deflection sensing
- Sized to driver current sense resolution & motor stall torque

KRAKEN Mass

The mass of the KRAKEN arm varies with joint configuration and radiation environment

Configuration	Mass in kg (LEO)	Mass in kg (GEO)
F/T, L,L,M,M,S,S,S	7.06	9.18
F/T, XL,XL,L,L,M,M,M	10.23	13.30
F/T, All Small	4.97	6.46
F/T, All Medium	7.01	9.11
F/T, All Large	10.28	13.36
F/T, All X-Large	15.13	19.67

Active Compliance Demo

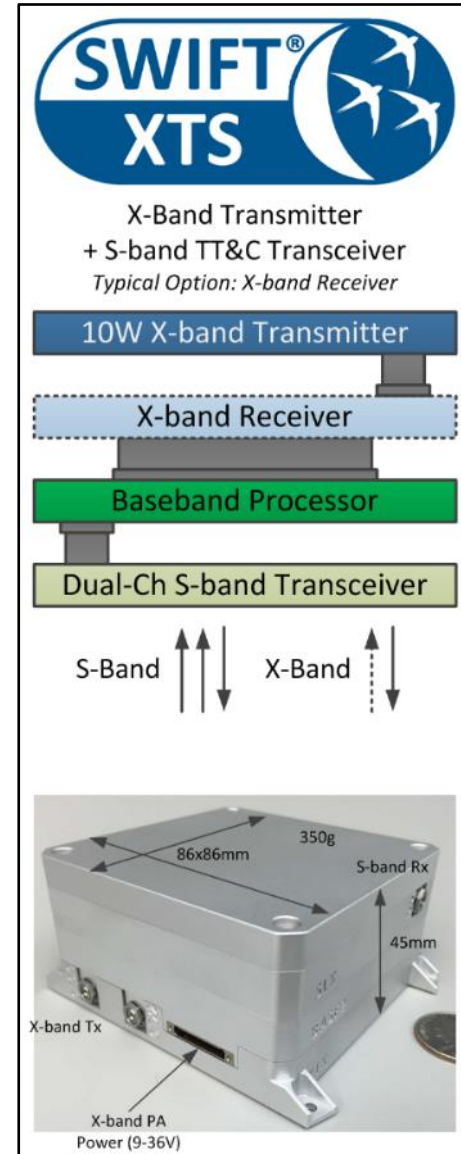

Feedback Gain (Nm/Rad)

Disturbance (Nm)

- **Goal**
 - Support high-performance force control for lunar & deep-space missions
- **Flight Controller Requirements**
 - Flight qualified for GEO
 - EtherCAT Master
 - Close 1kHz control loop
 - Execute feedforward model in real-time
- **SWIFT Software-Defined Radio**
 - Baseband processing module*
 - 7 radios operational in LEO
- **Mass: 100g → 1kg depending upon environment**

*All KRAKEN prototypes run on SWIFT baseband-equivalent prototypes

- **AXON Connector:**
Androgynous Robotic Tool-change Interface (ARTIE)
 - Compact hot-swap capability for docking ports & end-effectors
 - Wireless power/data interface
 - First-contact ESD protection for on-orbit servicing
 - Power protection safe-to-connect functionality
 - Wide alignment tolerances for autonomous applications
 - Mass ~ 500g

OSAM - The Longest Meter

- **Control problems in the last meter after rendezvous and prox ops**
 - **Client Characterization**
 - **Soft-Capture**
 - **Vibration Mitigation**
 - **Dynamic Mass Properties**
 - **Coupled ADCS**

- **AXON Connector**
Low-profile Soft Capture End Effector
 - Fully passive client-side fixture
 - Rigid, un-powered mechanical mate within 0.5 seconds after trigger set
 - Optional wireless power & data interface
 - First-contact ESD protection for on-orbit servicing
 - Power protection safe-to-connect functionality

CYLON Multi-Arm Controls

Development Environment for TUI's Distributed ACVMS system:

- **Spacecraft configurations for the platform architecture**
 - Sensor and actuator models
 - Dynamics (mass characteristics and configuration)
 - Network types (eg physical/wireless network)
 - Physical structure configuration
- **Control software**
 - Local spacecraft attitude and translational control
 - Formation control/inter-agent control
 - Force minimization control for rigid formations
- **Satellite state estimation**
 - State estimation techniques for satellite attitude and position
 - Sensor fusion techniques dependent on sensor configuration

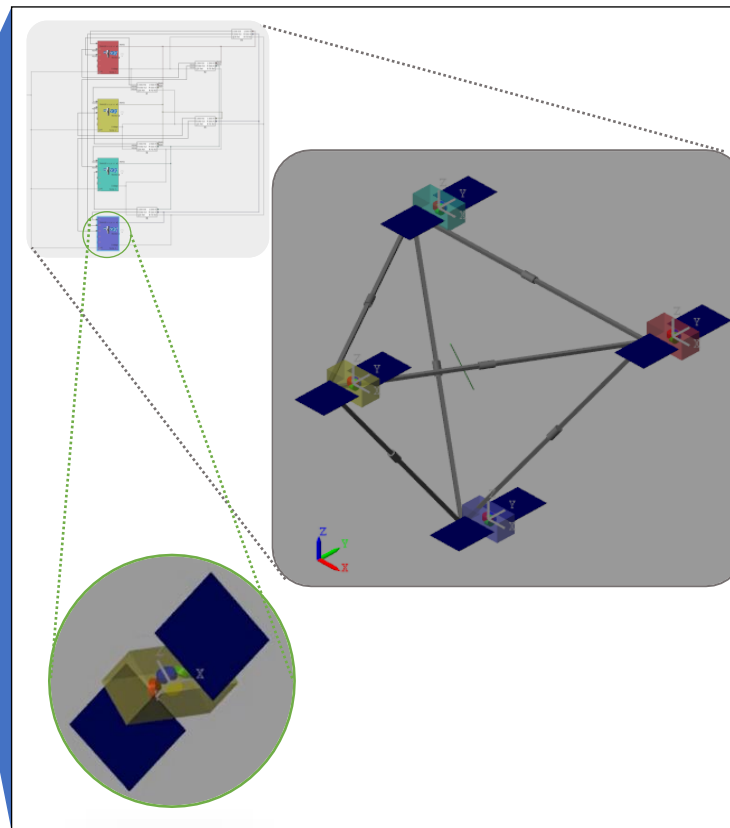

MOSAIC is a Simulink-based environment for developing and testing satellite assembly, servicing, and formation flight control methods

Multi-Objective Simulation for Aerospace Inter-agent Control (MOSAIC)

- MOSAIC is a configurable orbital simulation environment for development and testing of multi-body dynamics control methods.

- Satellite network control
- Local satellite control

- Satellite state estimation
- Satellite instrumentation

Electromechanical connector for:

- Integration of payloads onto hosted payload platforms, either pre-launch or on-orbit
- On-orbit assembly of modular space systems

Features:

- Androgynous – either side can secure or separate the connection
- Safe-to-mate sensing capabilities
- Actuated cover protects electrical/optical connections from space environment

- **Multi-agent cargo transfer**
 - Fill software/controls gaps for payload transport
- **Develop on-line mass property estimator**
 - Automatically update Astrobee mass properties without needing foreknowledge of cargo

Conceptual render of an Astrobee bringing a Nanolabs (by Nanoracks) payload to MANTIS for installation(left), and tugging a double locker (right).

MANTIS

The MANTIS ISS payload utilizes TUI's *KRAKEN* Robotic Arm and hot swappable end-effectors for semi-autonomous telerobotics on the ISS – saving crew time and demonstrating crucial capabilities for Gateway and OSAM activities.

MANTIS EDM

Development Timeline

2019

2020

2021

2022

Phase II

Phase II-E

Phase III

★ Launch

Develop and test crucial capabilities for applications in OSAM, Gateway, the Moon, Mars, and beyond

★ Increase scientific productivity of ISS by enabling researchers on the ground to operate ISS experiments

★ Increase commercial productivity of the ISS by enabling automated in-space fabrication processes and on-demand sample return

★ Inspire the next generation of scientists, engineers and leaders through hands-on STEM outreach and education

MANTIS – Designed for Astronaut Safety
